

# Hardik Yadav — Personal Brand SEO Audit & Implementation Report

**Prepared for:** hardikyadav.vercel.app **Scope:** Technical SEO, content, entity/brand strategy, structured data, and a 90-day roadmap **Audit method:** Live crawl of primary domain + 3 sampled duplicate domains, SERP/competitive research, Google guideline review (as of Sept 2026) **Labeling convention:** Anything I could not directly confirm is marked **[UNVERIFIED]**. I did not invent facts, quotes, metrics, or claims.

## 1. Executive Summary

The site is a **Next.js portfolio deployed on Vercel**, currently branded as **"HRDK"** rather than "Hardik Yadav." It is well-built visually (interactive keyboard demo, smooth animations, custom logo) but has three categories of problems that will actively block the stated goal of ranking for "Hardik Yadav" and related queries:

- 1. Identity/entity confusion.** The site's `<title>` and meta description brand the person as "HRDK," not "Hardik Yadav." Google cannot associate a page with a name that barely appears in its metadata.
- 2. Leftover template content that is off-topic or fabricated.** The About page still contains **interior-design/architecture agency copy** ("Interior," "Exterior," "Decoration," "Planning" services) that has nothing to do with software development. The Blog page displays **testimonial quotes attributed to named, identifiable real people** (e.g., a "CEO of Vercel" testimonial) that appear to be unedited template placeholder content, not real statements — this is a **fake-testimonial/impersonation risk**, not just an SEO issue, and should be treated as the single highest-priority fix on the entire site. The Contact page has stray, unrelated song-lyric text embedded in it. The FAQ page asks generic "digital agency" questions ("What services does your digital agency offer?") instead of answering "Who is Hardik Yadav?"
- 3. Duplicate-domain risk.** Of the 8 domains you listed, the 3 I was able to directly inspect (`whoishardik`, `hardikai`, `hardikcoding`) are **byte-for-byte identical deployments** of the primary site — same title, same copy, same broken project links — with no canonical tag pointing back to the primary domain. This is a textbook duplicate-content configuration that dilutes ranking signal instead of consolidating it.

None of this requires a redesign. It requires content correction, metadata correction, structured data, and domain consolidation — all achievable without touching the visual design, exactly as you specified.

**Reality check on the core goal:** "Hardik Yadav" is a very common Indian name. My SERP research found 300+ people named "Hardik Yadav" on LinkedIn alone, several of them software engineers, plus unrelated GitHub users with similar handles. Ranking #1 for the bare query "Hardik Yadav" nationally is unrealistic in the short-to-medium term and partly outside your control. The realistic, compliant target is **branded long-tail dominance** ("Hardik Yadav developer," "Hardik Yadav full stack developer," "Hardik Yadav portfolio," "HRDK developer") plus building a coherent entity (name + handle + GitHub + LinkedIn + site) that Google can confidently disambiguate — not out-competing every other Hardik Yadav for the single bare name.

## 2. Website Overview

| Item                                           | Finding                                                                                                                                                                                                                                     |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stack                                          | Next.js (App Router), image optimization via <code>/_next/image</code> , hosted on Vercel                                                                                                                                                   |

## 3. Domain Audit

You listed 8 domains. I directly fetched and compared 4 of them (primary + 3 samples). The 3 samples were **identical deployments** of the same codebase and content as the primary — same `<title>`, same hero copy, same broken project links, footer links pointing back to `hardikyadav.vercel.app`. Based on that consistent pattern and the naming convention, I'm treating the remaining domains as **highly likely** to be the same duplicate build, but flagging them **[UNVERIFIED]** individually — check each before implementing redirects.

| Domain                                  | Observed status                              | Purpose (inferred)                    | Recommendation                                                                                                                                                          | SEO reason                                                                                                                                                                             |
|-----------------------------------------|----------------------------------------------|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>hardikyadav.vercel.app</code>     | Live, full content                           | <b>Canonical/primary</b>              | <b>Keep as the single source of truth</b>                                                                                                                               | Matches your legal name; the entity Google should converge on                                                                                                                          |
| <code>whoishardik.vercel.app</code>     | Live, <b>identical duplicate</b> (confirmed) | Likely an earlier deploy or name-grab | <b>301/permanent redirect → primary</b>                                                                                                                                 | Exact duplicate content on a separate domain splits link equity and risks Google choosing the wrong canonical, or filtering both as near-duplicates                                    |
| <code>hardikai.vercel.app</code>        | Live, <b>identical duplicate</b> (confirmed) | Name-grab / AI-branding experiment    | <b>301 redirect → primary</b> , unless you have a <i>genuinely distinct</i> AI-projects microsite planned — if so, it needs unique content, not a copy of the main site | Same reasoning; "AI" angle is currently not represented in the duplicate content, so it isn't earning its own existence yet                                                            |
| <code>hardikcoding.vercel.app</code>    | Live, <b>identical duplicate</b> (confirmed) | Name-grab                             | <b>301 redirect → primary</b>                                                                                                                                           | Same as above                                                                                                                                                                          |
| <code>hardikchatgpt.vercel.app</code>   | Not directly fetched                         | Likely name-grab                      | <b>301 redirect → primary</b> [UNVERIFIED — confirm content before redirecting]                                                                                         | If identical, same duplicate-content risk                                                                                                                                              |
| <code>hardikgoogle.vercel.app</code>    | Not directly fetched                         | Likely name-grab                      | <b>301 redirect → primary</b> [UNVERIFIED]                                                                                                                              | Same                                                                                                                                                                                   |
| <code>hardiky.vercel.app</code>         | Not directly fetched                         | Likely name-grab / shorthand          | <b>301 redirect → primary</b> [UNVERIFIED]                                                                                                                              | Same                                                                                                                                                                                   |
| <code>hardikdeveloper.vercel.app</code> | Not directly fetched                         | Strong keyword match to your goal     | <b>Best candidate to actually keep live as a mirror, IF and only if it's set with a canonical tag pointing to the primary domain</b> — otherwise redirect               | A keyword-matched domain with a <code>rel=canonical</code> to the primary can still safely exist without being penalized; without the canonical tag it's a duplicate-content liability |

**Bottom line:** you do not need 8 domains. Google does not reward owning multiple domains that repeat the same content — it can suppress them as duplicates or split authority between them. Pick **one** canonical domain (`hardikyadav.vercel.app`),

or a custom domain like `hardikyadav.dev` if you acquire one — see §24), 301-redirect everything else to it, and stop deploying new copies to new subdomains. If you later want `hardikdeveloper` or `hardikai` to be real, distinct projects (e.g., an actual AI-tools showcase), they need **original content**, not a copy of the portfolio — otherwise redirect them too.

## 4. Technical SEO Audit

| Check                      | Finding                                                                                                                                                                                   | Priority         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Title tags                 | Identical across all pages, brand mismatch ("HRDK" vs "Hardik Yadav")                                                                                                                     | P0               |
| Meta descriptions          | Identical across all pages (should be unique per page)                                                                                                                                    | P0               |
| H1 usage                   | Home has no clear single keyword-rich H1 ("Build Your Digital Empire" is generic agency copy); About H1 is "Visionary Builder" (not descriptive)                                          | P1               |
| Canonical tags             | None observed in fetched output on any page                                                                                                                                               | P0               |
| robots.txt                 | Could not be independently fetched in this session (tool restriction) — <b>[UNVERIFIED]</b> . Must be manually checked at <code>hardikyadav.vercel.app/robots.txt</code>                  | P0 (verify)      |
| sitemap.xml                | Same — <b>[UNVERIFIED]</b> , verify at <code>/sitemap.xml</code>                                                                                                                          | P0 (verify)      |
| manifest.webmanifest       | Not observed in fetched head data — <b>[UNVERIFIED]</b>                                                                                                                                   | P2               |
| Structured data / JSON-LD  | <b>None detected</b> on any crawled page                                                                                                                                                  | P0               |
| Open Graph / Twitter Card  | Not present in the fetched <code>&lt;head&gt;</code> data captured                                                                                                                        | P0               |
| Broken / placeholder links | 6 of 8 project "Explore Project" links point to <code>#</code> (Vertexiae, EarnetixHub, EarnetixUpdates, Garry Digital 360, Delta Traders, Ratna Kanchan)                                 | P0               |
| Image alt text             | Home/services images use generic Unsplash stock photography with no descriptive, brand-relevant alt text visible; Gallery page is almost entirely generic stock photos, not real work     | P1               |
| Duplicate content          | Blog, FAQ, About, Gallery, Contact all contain <b>generic template copy unrelated to a developer portfolio</b> (interior design services, "digital agency" FAQ, fake client testimonials) | P0               |
| JS rendering               | Content is server-rendered/pre-rendered as readable text in the fetched HTML (good — text is crawlable, not hidden behind client-only JS)                                                 | ✓ No issue found |
| URL structure              | Clean, short, keyword-relevant ( <code>/about</code> , <code>/projects</code> , <code>/blog</code> )                                                                                      | ✓ Good           |

| Check                   | Finding                                                                                                      | Priority                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| Language/locale content | Contact page contains an unrelated block of non-English song lyrics with no connection to the page's purpose | <b>P0</b> — remove; also a distraction from real contact intent |

## 5. Indexing & Crawlability

- Text content **is** present in server-rendered HTML (confirmed by direct fetch), which is good for crawlability — Googlebot should be able to read your actual words, not just a JS shell.
- Because **robots.txt and sitemap.xml could not be verified in this session**, you must manually confirm:
  - `robots.txt` exists, returns `200`, and does not accidentally `Disallow: /`
  - `sitemap.xml` exists, returns `200`, and lists all real routes with correct absolute URLs on the canonical domain
- With 4+ duplicate domains serving identical content, Google's indexer may pick an unexpected page as canonical, or treat the set as duplicate and index none of them well. This is very likely suppressing your current visibility for branded terms — it's a plausible primary reason "Hardik Yadav" searches don't currently surface this site prominently.
- No `rel=canonical` tag was observed anywhere. Every page should self-canonicalize to its exact primary-domain URL.

## 6. Current Content Audit (page by page)

| Page     | What's good                                                                                                                                                                                   | What's wrong / irrelevant                                                                                                                                                                                                                                      | Priority fix                                                                                                          |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Home     | Clear skills list (React, Next.js, Node.js, MongoDB, JS, Tailwind, Vite) matches your stated real stack; interactive "Command the Code" section is a genuinely distinctive, memorable feature | Hero copy ("Build Your Digital Empire," "Our Services," "SEO Optimization," "Digital Marketing") reads as a <b>generic agency template</b> , not a personal developer identity; no direct answer to "who is this" in the first screen                          | <b>P0</b> : Rewrite hero + services section around Hardik Yadav personally, not "we/our agency"                       |
| About    | The single sentence "I'm Hardik Yadav. I build digital excellence." is the clearest identity statement on the whole site                                                                      | The rest of the page is <b>unrelated interior-design/architecture agency template content</b> ("Interior," "Exterior," "Decoration," "Planning," "Execution," house photography) — this actively confuses both users and Google about what this page/person is | <b>P0 — highest content priority on the site.</b> Full rewrite required                                               |
| Projects | Real, named projects with descriptions (HRDKPen Code IDE, Vertex CRM, etc.) that                                                                                                              | 6 of 8 project cards link to <code>#</code> (dead links); no individual project pages/case studies; no tech-stack tags per project; images are local                                                                                                           | <b>P0</b> : fix dead links or clearly label unfinished projects; <b>P1</b> : build the case-study architecture in §12 |

| Page           | What's good                                                                             | What's wrong / irrelevant                                                                                                                                                                                                             | Priority fix                                                                                                                                                                                                    |
|----------------|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | plausibly demonstrate real work                                                         | screenshots (good) but filenames like <code>proj_task.png</code> aren't descriptive                                                                                                                                                   |                                                                                                                                                                                                                 |
| <b>Blog</b>    | Category taxonomy (Web Development, Programming, UI/UX) is reasonable                   | <b>Contains fabricated-looking testimonials attributed to named real people</b> (e.g., a "CEO of Vercel" quote) and generic "Building Modern Web Applications with React" placeholder article titles with no real content behind them | <b>P0, urgent:</b> remove all testimonial/quote content attributed to real named individuals immediately — this is a trust/legal risk, not just an SEO one. Replace articles with real, first-hand posts (\$13) |
| <b>FAQ</b>     | Accordion UX pattern is fine structurally                                               | Every question is generic-agency ("What services does your digital agency offer?", "How much does a new website cost?") — <b>zero questions answer "who is Hardik Yadav"</b> despite that being your core objective                   | <b>P0:</b> full content replacement, see \$14                                                                                                                                                                   |
| <b>Gallery</b> | N/A                                                                                     | Entirely generic Unsplash stock photography with no connection to your actual work, desk, or projects; adds no E-E-A-T value and no unique images for Google Images                                                                   | <b>P1:</b> replace with real screenshots/photos or remove the page                                                                                                                                              |
| <b>Contact</b> | Real, correct contact details (email, phone, location) present and consistent site-wide | Contains an unrelated block of song-lyric text with no relation to contact, plus leftover template headings ("DIGITAL / PR / DUCTS / DESIGN / CODE") that read as broken/incomplete layout text                                       | <b>P0:</b> remove stray text; simplify to name, role, location, contact form, contact methods                                                                                                                   |

## 7. Keyword Research & Search Intent Map

Search demand for a personal name is inherently **navigational** (someone already knows the name) or **disambiguating** ("who is this person"). Because "Hardik Yadav" is a common name, most volume near the bare name will be **shared with unrelated people of the same name** — your realistic wins are in the qualified, multi-word terms.

| Cluster                                   | Example queries                                                                                                                                   | Intent                                                                     | Best target page                                                                                                     |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Bare name (low control, high competition) | "Hardik", "Hardik Yadav"                                                                                                                          | Navigational, ambiguous — competes with 300+ others                        | Home (via strong Person/entity signals — you cannot "win" the bare query outright, only strengthen your slice of it) |
| Disambiguation                            | "who is Hardik", "who is Hardik Yadav"                                                                                                            | Informational, wants a quick identity answer                               | About page + FAQ ("Who is Hardik Yadav?")                                                                            |
| Role + name                               | "Hardik Yadav developer", "Hardik developer", "Hardik Yadav full stack developer", "Hardik Yadav software engineer", "Hardik Yadav web developer" | Navigational/informational, <b>your best realistic ranking opportunity</b> | Home title/H1, About                                                                                                 |
| Stack-specific                            | "Hardik Yadav React developer", "Hardik Yadav Next.js developer", "Hardik Yadav Node.js developer"                                                | Highly qualified, low competition                                          | Skills page, individual project pages                                                                                |
| Portfolio/work                            | "Hardik Yadav portfolio", "Hardik Yadav projects", "Hardik coding"                                                                                | Wants to see work                                                          | Projects page                                                                                                        |
| Geographic                                | "Hardik Yadav developer India", "full stack developer Bokaro Steel City"                                                                          | Local/recruiter intent                                                     | About/Contact (you already have real location data — use it)                                                         |
| Brand alias                               | "HRDK developer", "HRDK portfolio"                                                                                                                | Navigational, matches your current site branding                           | Home (since "HRDK" is already your live brand mark)                                                                  |

#### Additional realistic intents worth targeting (not in your original list):

- "Hardik Yadav GitHub"
- "Hardik Yadav LinkedIn"
- "Hardik Yadav [specific project name]" (e.g., "HRDKPen Code IDE," "Vertex CRM") — project names are **unique strings with zero competition**, and are your fastest realistic path to a #1 ranking
- "hire full stack developer Bokaro" / "hire React developer India" (commercial intent, if you want freelance/job leads)

## 8. Brand/Entity SEO Strategy

**The core tension on this site:** you are branded as "HRDK" everywhere (logo, title tag, meta description, footer copyright), but your SEO goal is to rank for "Hardik Yadav." Google cannot strongly associate a page with a name that isn't prominent in its title, headings, and structured data.

#### Recommended resolution — don't choose one, connect both:

- Keep "HRDK" as your visual/logo brand mark (it's a fine, memorable design asset).

- Make **"Hardik Yadav"** the primary text identity in `<title>`, H1, meta description, and JSON-LD `Person.name`, with "HRDK" as an `alternateName`.
- This lets you legitimately target both "Hardik Yadav" and "HRDK developer" queries without keyword stuffing — they're both real, true names for the same person.

**How Google can understand "Hardik Yadav = developer = full-stack developer = website owner = author = project creator" without manipulation:**

1. Consistent **full name + role** in title/H1 across every page (not identical boilerplate — vary the phrasing naturally per page).
2. **Person schema** (§16) with `sameAs` linking to your real GitHub, LinkedIn, Instagram — this is Google's standard mechanism for entity disambiguation, and it's exactly what it's designed for.
3. **First-person, first-hand content** (real project write-ups, real blog posts, real photos) — this is what Google's Helpful Content guidance and E-E-A-T signals actually reward, and it's the opposite of the current generic template copy.
4. **Consistent NAP-style identity** (Name, role, location) repeated naturally across About/Contact/FAQ — not stuffed, just consistently true.
5. Linking your GitHub commits/repos and LinkedIn profile back to the same site, and the site linking out to them — mutual confirmation of identity ("sameAs" both directions) is a standard, compliant entity-building technique, not manipulation.

## 9. Homepage Content Blueprint

| Element                                | Recommendation                                                                                                                                                                     |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Title tag</b>                       | <code>Hardik Yadav (HRDK) – Full-Stack Developer &amp; Software Engineer</code> (≤60 chars)                                                                                        |
| <b>Meta description</b>                | <code>Hardik Yadav (HRDK) is a full-stack developer from India building web apps with React, Next.js, and Node.js. Explore projects, skills, and contact info.</code> (≤155 chars) |
| <b>H1</b>                              | <code>Hardik Yadav – Full-Stack Developer</code>                                                                                                                                   |
| <b>Hero headline</b>                   | <code>I'm Hardik Yadav. I build full-stack web applications.</code>                                                                                                                |
| <b>Hero paragraph</b>                  | One real paragraph: who you are, what you build, what stack, where based — no agency "we/our brand" language                                                                       |
| <b>Primary CTA</b>                     | "View Projects" → <code>/projects</code>                                                                                                                                           |
| <b>Secondary CTA</b>                   | "Get in Touch" → <code>/contact</code>                                                                                                                                             |
| <b>About section (on-page snippet)</b> | 2–3 sentences pulled from the real About page, "Read my full story →" link                                                                                                         |
| <b>Skills section</b>                  | Keep the existing React/Next.js/Node/MongoDB/JS/Tailwind/Vite grid — it's accurate and already good; add 1-line "how I use this" per skill                                         |
| <b>Projects section</b>                | 3 featured real projects with live-demo links, not the current "#" dead links                                                                                                      |

| Element                           | Recommendation                                                                                                                                                                                                        |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Blog section</b>               | 2–3 real article teasers (once real posts exist — see §13); omit this section entirely until real content replaces the fake-testimonial page                                                                          |
| <b>AI section</b>                 | Only if AI work is real/verified — e.g., the "AI chat agent" mentioned inside HRDKPen Code IDE is a legitimate, specific AI feature to highlight; don't create a generic "AI expert" claim beyond what's demonstrable |
| <b>Developer identity section</b> | Short "Facts" list: name, role, stack, location, years active [UNVERIFIED — fill with real, verifiable numbers only]                                                                                                  |
| <b>Social proof section</b>       | <b>Remove fabricated testimonials.</b> If you have zero real testimonials, omit this section — an empty, honest site beats a fake one, both ethically and under Google's spam policies                                |
| <b>FAQ section</b>                | 3–4 top FAQ questions inline, link to full <code>/faqs</code>                                                                                                                                                         |
| <b>Contact section</b>            | Name, email, location, contact form — no unrelated content                                                                                                                                                            |
| <b>Footer</b>                     | Keep current social links; add a one-line copyright: <code>© 2026 Hardik Yadav (HRDK). All rights reserved.</code> (currently says only "HRDK")                                                                       |

## 10. About Page Blueprint

**Current problem:** ~80% of this page is interior-design agency template copy. **This is a P0 fix.**

Recommended structure (fill only with facts you can verify — do not invent history):

- H1:** `About Hardik Yadav`
- Identity paragraph: name, current role/status (student/freelancer/employed — [UNVERIFIED, use your real status]), based in Bokaro Steel City, India
- Developer background — real narrative of how you got into programming (only real facts)
- Technical interests — full-stack development, AI integrations, UI/UX (only list what's demonstrable via your projects)
- Development philosophy — you already have good raw material for this in the Home page's "Words to Live By" / "Think. Plan. Execute." sections; move/adapt that content here where it fits an About narrative better than a homepage hero
- Featured projects (2–3, linking to `/projects`)
- Learning/education note if real and relevant [UNVERIFIED]
- Link out to GitHub/LinkedIn as "connect with me" — supports the `sameAs` entity strategy in §8

Remove entirely: Interior/Exterior/Decoration/Planning/Execution blocks, the house photography, "Our Portfolio" agency language.

## 11. Skills Architecture

Only build pages/sections for skills **actually evidenced** by the projects you showed me (React, Next.js, Node.js, Express.js,

MongoDB, JavaScript, Tailwind CSS, Vite). Do not add skills that aren't demonstrated anywhere on the site — that would be an unverifiable claim.

| Cluster  | Skills to include                                                                 | Skill sub-pages?                                                                                                                                 |
|----------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Frontend | React, Next.js, Tailwind CSS, JavaScript                                          | No separate URLs — keep as sections on one <code>/skills</code> page unless you have 3+ projects and articles per skill (not currently the case) |
| Backend  | Node.js, Express.js                                                               | Same — one page                                                                                                                                  |
| Database | MongoDB                                                                           | Same                                                                                                                                             |
| Tooling  | Vite, Git/GitHub                                                                  | Same                                                                                                                                             |
| AI       | Only the AI chat agent feature inside HRDKPen (verified from project description) | Mention under Projects, not as a standalone "AI Developer" claim until more AI work exists                                                       |

**Recommendation: consolidate into one `/skills` page**, not individual skill URLs. With this project count, individual skill pages would be thin content (an SEO negative), and a single well-structured page with clear H2s per skill and internal links to the projects that prove each skill is stronger than fragmenting into many small, weak pages.

## 12. Projects SEO

**Current state:** 8 project cards, only 2 with live external links (HRDKPen Code IDE, Vertex CRM). The other 6 link to `#`.

**Recommendation:** Give each *real, live* project its own indexable page at `/projects/[slug]` (e.g., `/projects/hrdkpen-code-ide`). Do **not** create pages for the 6 projects with dead `#` links until they have a real destination — an indexable page with no working demo and no substance is thin content.

Per-project page template:

| Field                | Guidance                                                                                                                    |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Title                | <code>HRDKPen Code IDE – Project by Hardik Yadav</code>                                                                     |
| Meta description     | One real sentence: what it is, what it does, what stack                                                                     |
| H1                   | Project name                                                                                                                |
| Summary              | 2–3 sentences                                                                                                               |
| Problem              | What real problem this solves                                                                                               |
| Solution             | What you built                                                                                                              |
| Tech stack           | Tag list (React, CodeMirror, etc. — only real, verified tools)                                                              |
| Architecture         | Real, brief technical description if you can write it accurately                                                            |
| Challenges/decisions | Genuine first-hand detail — this is exactly the E-E-A-T signal Google's guidelines reward and generic AI content can't fake |
| Result               | Real outcome if measurable, otherwise omit rather than invent                                                               |
| Screenshots          | Your existing local screenshots ( <code>proj_ide_hrdkpen.png</code> etc.) — rename descriptively, add real alt text         |
| Live demo link       | Only if functional                                                                                                          |
| GitHub link          | If the repo is public                                                                                                       |
| Related articles     | Link to blog posts once real ones exist                                                                                     |

This turns your projects list from a gallery into **evidence of expertise** — which is the single most persuasive and most Google-rewarded thing a personal developer site can have, and it's 100% consistent with "no fake claims."

## 13. Blog SEO Strategy

**First: remove the fake testimonials on the current `/blog` page before publishing anything else.** That page as it stands is a liability, not an asset.

30 article ideas, grouped by cluster, all designed around **first-hand experience** (write what you actually did, not generic tutorials):

| #  | Title                                                      | Search intent       | Primary keyword                      | Target page link        | Related project/skill |
|----|------------------------------------------------------------|---------------------|--------------------------------------|-------------------------|-----------------------|
| 1  | Building an AI-Powered Code Editor: Lessons from HRDKPen   | How-to/case study   | ai code editor project               | /projects/hrdkpen       | HRDKPen               |
| 2  | Why I Chose CodeMirror Over Monaco for a Web IDE           | Comparison          | codemirror vs monaco                 | HRDKPen                 | React                 |
| 3  | Building a CRM Dashboard with Role-Based Access in Next.js | Case study          | next.js rbac dashboard               | Vertex CRM              | Next.js               |

| 28 | Why I Rewrote My Portfolio's About Page                            | Meta/personal       | developer portfolio about page | About                         | —                     |
| 29 | A Practical Guide to Image Optimization in Next.js                 | Tutorial            | next.js image optimization     | Home                          | Performance           |

| #  | Title                                        | Search intent          | Primary keyword              | Target page link | Related project/skill |
|----|----------------------------------------------|------------------------|------------------------------|------------------|-----------------------|
| 30 | What I Learned Shipping 8 Side Projects Solo | Personal/retrospective | solo developer side projects | Projects         | —                     |

**Rule for all 30:** publish only once you can write the real technical detail from experience. A thin, generic AI-sounding article on any of these topics is worse than not publishing — it repeats the exact "helpful content" problem currently on the Blog page.

## 14. FAQ Strategy

Replace the current generic-agency FAQ entirely. Recommended real question set:

- Who is Hardik Yadav?
- What does Hardik Yadav do?
- Is Hardik Yadav a full-stack developer?
- What technologies does Hardik Yadav use?
- Does Hardik Yadav build AI-integrated applications?
- What projects has Hardik Yadav built?
- Where can I see Hardik Yadav's code / GitHub?
- Where can I read Hardik Yadav's technical articles?
- Is Hardik Yadav available for freelance or full-time work? [only if true]
- How can I contact Hardik Yadav?
- Where can I find Hardik Yadav on social media?
- Where is Hardik Yadav based? (*Bokaro Steel City, India — real, verified*)
- What is "HRDK"? (*Explain the brand-name relationship directly — this single answer does more for entity disambiguation than almost anything else on the site*)

**Google's current FAQ rich-result limitation (important):** Google has restricted FAQ rich results in search to a narrow set of authoritative government/health sites; for a personal portfolio, FAQPage schema is unlikely to produce a visible rich snippet even if implemented correctly. Implement it anyway for good on-page structure and potential future eligibility, but don't treat rich-result appearance as a guaranteed or near-term outcome — verify current behavior at implementation time via Google Search Central documentation, since policies do change.

## 15. Social / Entity SEO

| Profile                                                                                | Verified?              | Recommended connection                                                                                                                               |
|----------------------------------------------------------------------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| GitHub — <a href="https://github.com/fullstack-hardik">github.com/fullstack-hardik</a> | Confirmed link on-site | Add to <code>Person.sameAs</code> ; link from every project's "GitHub" button; ensure the GitHub bio names "Hardik Yadav" and links back to the site |

```
{
  "@context": "https://schema.org",
  "@type": "Person",
  "@id": "https://hardikyadav.vercel.app/#person",
  "name": "Hardik Yadav",
  "alternateName": "HRDK",
  "url": "https://hardikyadav.vercel.app/",
  "jobTitle": "Full-Stack Developer",
  "address": {
    "@type": "PostalAddress",
    "addressLocality": "Bokaro Steel City",
    "addressCountry": "IN"
  },
  "sameAs": [
    "https://github.com/fullstack-hardik",
    "https://www.linkedin.com/in/hardik-yadav-682016301/",
    "https://instagram.com/official_hrdik_yadav"
  ]
}
```

```
{
  "@context": "https://schema.org",
  "@type": "WebSite",
  "@id": "https://hardikyadav.vercel.app/#website",
  "url": "https://hardikyadav.vercel.app/",
  "name": "Hardik Yadav (HRDK)",
  "publisher": { "@id": "https://hardikyadav.vercel.app/#person" }
}
```

**ProfilePage (About page):** wrap the Person schema in a `ProfilePage` type with `mainEntity` pointing at `#person`.

**BreadcrumbList (every inner page):** standard 2–3-level breadcrumb (Home → Section → Page).

**Article/BlogPosting (each real blog post, once published):** `headline` `author: { "@id": ".../#person" }` `datePublished` `image`.

**FAQPage (FAQ page):** standard `mainEntity` array of `Question`/`acceptedAnswer` pairs, using the real questions from §14.

**Do not implement:** Course schema (no courses exist), Organization schema (this is a personal site, not a company — using Organization schema for a one-person portfolio can misrepresent the entity type to Google), Review/AggregateRating schema (no real reviews exist — this would be exactly the "fake reviews" risk you explicitly want to avoid).

## 17. robots.txt

[UNVERIFIED current state — must be checked manually at `/robots.txt` before implementing this]. Recommended production version:

```

User-agent: *
Allow: /

Sitemap: https://hardikyadav.vercel.app/sitemap.xml
```

Notes:

- `Allow: /` explicitly permits full crawling — appropriate since there are no admin/private routes to hide.
- If a `/api/` route or any auth-gated route exists (e.g., "Sign Up" button suggests a possible auth flow), add `Disallow: /api/` and `Disallow: /dashboard/` (or whatever the real private route is) — verify what routes actually exist behind that Sign Up button before finalizing.
- One `Sitemap:` line pointing to the canonical sitemap URL.

## 18. Sitemap Strategy

- Include: `/`, `/about`, `/projects`, `/projects/[slug]` (only for live projects), `/blog`, `/blog/[slug]` (only for published posts), `/faqs`, `/contact`.
- Exclude: `/gallery` if it remains generic stock-photo filler (low value, consider removing the page rather than indexing it), any `#`-anchor-only routes, any future auth/dashboard routes.
- Use real `lastmod` dates — don't fake freshness signals with today's date on unchanged pages.
- At this site size (under ~50 URLs), a single `sitemap.xml` is sufficient; no sitemap index needed yet. Revisit if blog posts + project pages exceed ~200 URLs.

Example:

```

<?xml
```

```
<?xml version="1.0" encoding="UTF-8"?>
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>https://hardikyadav.vercel.app/</loc>
    <lastmod>2026-09-12</lastmod>
    <changefreq>weekly</changefreq>
    <priority>1.0</priority>
  </url>
  <url>
    <loc>https://hardikyadav.vercel.app/about</loc>
    <lastmod>2026-09-12</lastmod>
    <changefreq>monthly</changefreq>
    <priority>0.9</priority>
  </url>
  <url>
    <loc>https://hardikyadav.vercel.app/projects</loc>
    <lastmod>2026-09-12</lastmod>
    <changefreq>monthly</changefreq>
    <priority>0.9</priority>
  </url>
</urlset>
```

(Generate dynamically via Next.js `app/sitemap.ts` rather than a static file, so it stays in sync automatically as pages are added.)

## 19. manifest.webmanifest

```
{
  "name": "Hardik Yadav (HRDK) — Full-Stack Developer",
  "short_name": "HRDK",
  "description": "Portfolio of Hardik Yadav, a full-stack developer building web applications with React, Next.js, and Node.js.",
  "start_url": "/",
  "display": "standalone",
  "icons": [
    { "src": "/icon-192.png", "sizes": "192x192", "type": "image/png" },
    { "src": "/icon-512.png", "sizes": "512x512", "type": "image/png" }
  ],
  "theme_color": "#000000"
}
```

Replace `theme_color` with your real brand color [UNVERIFIED — confirm the actual hex used in the design].

## 20. Image SEO

- Rename project screenshots from `proj_task.png`, `proj_blog.png` etc. to descriptive names: `vertex-crm-dashboard.png`, `hrdkpen-code-editor-screenshot.png`.
- Alt text: describe what's shown, not keyword-stuffed — e.g., `alt="Vertex CRM dashboard showing employee task list and activity log"`, not `alt="Hardik Yadav developer CRM React Node.js portfolio"`.
- Replace generic Unsplash stock photos on Home/About/Gallery with real screenshots, real workspace photos, or remove those image blocks — stock photography earns nothing for a personal brand and can't rank in Image Search against the millions of other sites using the same free stock photo.
- Serve modern formats (Next.js `<Image>` already handles WebP/AVIF automatically via `/_next/image` — confirmed in use) — keep using it, including for the profile photo and project screenshots once real ones are added.
- Open Graph image: create one dedicated 1200×630 image with your real name and role, used site-wide via default OG image, plus per-project OG images for project pages once they exist.

## 21. Performance SEO

Constraint honored: **no visual/design changes**, only technical optimization underneath.

- The homepage loads a large hero **video** from an external CloudFront URL — video hero assets are one of the most common LCP/CLS culprits. Recommend: compress, lazy-load below-the-fold instances, ensure a poster frame is set so there's no layout shift while it loads, and confirm it isn't autoplaying full-resolution on mobile.
- Continue using Next.js `<Image>` (already in use) for all images, including replacing the raw Unsplash `<img>`-style URLs with locally optimized/proxied versions.
- Audit third-party script weight (fonts, analytics, any embedded widgets) — nothing in the crawl suggested heavy third-party tags, but this should be measured directly with Lighthouse/PageSpeed Insights, which I could not run in this session.
- Code-split the Projects and Gallery pages if the stock-image-heavy Gallery page remains, since it's the least SEO-valuable page and shouldn't cost the site its performance budget.
- Recommend running actual Core Web Vitals field data (via Search Console once verified, or PageSpeed Insights) as a first implementation step — this report identifies *risk areas*, not measured LCP/INP/CLS numbers, which I don't have access to.

## 22. Accessibility SEO

- Fix generic, low-value alt text (\$20) — this is both an accessibility and SEO fix simultaneously.
- Confirm all "Explore Project" and "Learn more" links are real `<a href>` elements (not `<div onClick>`) so they're both keyboard-accessible and crawlable — several currently point to `#`, which fails both accessibility (no real destination) and SEO (no real internal link value).
- Confirm heading hierarchy is sequential (H1 → H2 → H3) rather than skipping levels — not fully verifiable from the fetched text alone; check in dev tools.
- Ensure the contact form has proper `<label>` elements tied to each field (Full Name, Email Address, Your Message) — accessible forms are also more reliably parsed by crawlers evaluating page purpose.
- Ensure sufficient color contrast on any light-on-dark or dark-on-light text in the animated sections — not verifiable from text-only fetch; check visually.

## 23. Content Entity Map

This is the semantic skeleton the JSON-LD in §16 encodes literally — every arrow above should correspond to a real schema relationship, not just a visual sitemap.

## 24. Backlink Strategy

**Realistic value tiers:**

### 90-day authority plan (realistic, not manufactured):

- **Days 1–30:** Fix GitHub repo READMEs to link back to the site; complete LinkedIn profile with matching headline and website link; publish first 2–3 real blog posts and cross-post to Dev.to/Hashnode with canonical tags pointing to your site.
- **Days 31–60:** Submit to legitimate developer portfolio directories [UNVERIFIED — research current, real, non-spammy directories at implementation time rather than using a fixed list, since directory quality/legitimacy changes]; contribute to one real open-source project and ensure your GitHub profile is the credited author.
- **Days 61–90:** If genuinely warranted, pitch one guest post or one podcast/interview appearance in a developer community you're actually active in; publish 2–3 more real blog posts with internal links to relevant project pages.

No fake reviews, no fake awards, no PBNs, no purchased links, at any stage.

## 25. Google Search Console Strategy

1. Verify **only the canonical domain** (`hardikyadav.vercel.app`) in Search Console — don't waste verification effort on duplicate domains you're redirecting away.
2. Submit the sitemap once it exists and is confirmed live.
3. Use the **URL Inspection tool** on `/`, `/about`, `/projects`, `/blog`, `/faqs` to confirm each is indexed and check "as rendered" HTML matches what a user sees.
4. Monitor the **Performance report** filtered to queries containing "hardik" to track branded-term visibility over time — this is your real feedback loop for whether these fixes are working.

5. Check the **Coverage/Pages report** for any of the duplicate domains still indexed after you redirect them, and use Search Console's removal tool if stale duplicate URLs linger.
6. Watch for **manual actions** — none expected if you follow this report, but the fake-testimonial content on the current Blog page is exactly the kind of thing that can attract a spam policy review, so fixing it before increasing site visibility is the right order of operations.

## 26. 90-Day Plan

### Day 1–7 (P0 — stop-the-bleeding):

- Remove fake testimonials from `/blog`
- Remove interior-design template content from `/about`
- Remove stray song-lyric text from `/contact`
- Replace generic FAQ questions with real "Who is Hardik Yadav" questions
- Fix or clearly label the 6 dead `#` project links
- Decide and execute domain consolidation (redirects) for confirmed duplicates

### Day 8–30 (P0/P1 — foundation):

- Rewrite Home + About with real, unique title/meta/H1 per page
- Implement Person, WebSite, ProfilePage, BreadcrumbList, FAQPage JSON-LD
- Verify/fix robots.txt and sitemap.xml
- Add canonical tags site-wide
- Publish first 2–3 real blog posts
- Complete GitHub/LinkedIn cross-linking

### Day 31–60 (P1 — expansion):

- Build individual project pages for live projects
- Replace Gallery stock photos with real content or remove the page
- Publish 3–5 more blog posts
- Submit sitemap, verify indexing in Search Console

### Day 61–90 (P2/P3 — authority & optimization):

- Pursue legitimate backlink opportunities (\$24)
- Run and act on real Core Web Vitals data
- Review Search Console query data for "hardik" terms and adjust content based on real query gaps found

## 27. Priority Fix List

| Priority | Fix                                                      |
|----------|----------------------------------------------------------|
| P0       | Remove fake testimonials attributed to real named people |
| P0       | Remove interior-design template content from About       |

| Priority | Fix                                                               |
|----------|-------------------------------------------------------------------|
| P0       | Remove stray lyric text from Contact                              |
| P0       | Fix/label 6 dead project links                                    |
| P0       | Unique title/meta description per page, all naming "Hardik Yadav" |
| P0       | Add canonical tags                                                |
| P0       | Verify robots.txt / sitemap.xml exist and are correct             |
| P0       | Consolidate duplicate domains                                     |
| P1       | Implement Person/WebSite/ProfilePage/FAQPage JSON-LD              |
| P1       | Rewrite FAQ content around real identity questions                |
| P1       | Replace stock Gallery photos                                      |
| P1       | Build individual project case-study pages                         |
| P2       | Publish real blog content per §13                                 |
| P2       | Image renaming/alt text pass                                      |
| P3       | Backlink outreach, guest posts, directory submissions             |

## 28. Risks

- **Legal/reputational risk (highest):** the testimonial quotes attributed to named real individuals (e.g., a named "CEO of Vercel") on the current Blog page could be read as false endorsement/impersonation if left live — recommend removing before any further SEO promotion, independent of ranking impact.
- **Duplicate content:** multiple identical domains could cause Google to index the wrong one as canonical, or suppress all of them.
- **Name collision:** "Hardik Yadav" is a common name; expectations for bare-name #1 ranking should be tempered — set goals around qualified long-tail terms instead.
- **Thin content:** publishing generic, non-first-hand blog posts to "fill" the 30-article list would recreate the exact helpful-content problem currently on the site — resist the urge to batch-publish before you have real things to say.
- **FAQ rich results:** Google's current policy limits FAQ rich snippets mostly to authoritative sites; don't count on rich-result visibility as a guaranteed outcome of implementing FAQPage schema — verify current policy before communicating expected outcomes to any stakeholder.

## 29. Final Implementation Checklist

- ☐ Remove fake testimonials (Blog)
- ☐ Remove interior-design content (About)
- ☐ Remove stray lyrics (Contact)
- ☐ Replace agency FAQ with identity FAQ
- ☐ Fix/label dead project links
- ☐ Unique per-page title + meta description
- ☐ Add canonical tags
- ☐ Verify/fix robots.txt
- ☐ Verify/fix sitemap.xml (dynamic via `app/sitemap.ts`)
- ☐ Add manifest.webmanifest
- ☐ Implement Person/WebSite/ProfilePage/BreadcrumbList/FAQPage JSON-LD
- ☐ Redirect confirmed duplicate domains (whoishardik, hardikai, hardikcoding + verify remaining 4)
- ☐ Cross-link GitHub/LinkedIn bios back to the site
- ☐ Build project case-study pages for live projects
- ☐ Replace stock Gallery images or remove page
- ☐ Rename image files + write descriptive alt text
- ☐ Add Open Graph/Twitter Card images
- ☐ Publish real blog content (only when genuinely ready)
- ☐ Submit sitemap + verify indexing in Search Console
- ☐ Re-check Core Web Vitals after video/image optimization

## 30. Antigravity Implementation Prompt

Copy everything in the box below as-is into the implementing AI/developer's task.

☐

## IMPLEMENTATION TASK: SEO & Content Remediation for hardikyadav.vercel.app

DO NOT CHANGE THE EXISTING UI DESIGN. Preserve exactly: layout, colors, typography, animations, cards, spacing, components, responsive behavior, and overall visual identity. Only modify: content/copy, metadata, semantic HTML structure, structured data, technical SEO files, image filenames/alt text, internal links, and underlying performance-related code (e.g., video/image loading strategy) — never the visual design itself.

### 1. CONTENT FIXES (do first, before any metadata work):

- /blog: remove all testimonial/quote blocks attributed to named real people. Remove placeholder article cards with no real content.
- /about: remove all interior-design/architecture agency content (Interior, Exterior, Decoration, Planning, Execution sections and associated house photography). Replace with a real bio for Hardik Yadav: identity, background, stack, philosophy, featured projects. Do not invent facts not provided by the site owner.
- /contact: remove the non-English song-lyric text block and the "DIGITAL / PR / DUCTS / DESIGN / CODE" fragment headings. Keep name, email (hardikyadaven@gmail.com), phone, location (Bokaro Steel City, India 827010), and the contact form.
- /faqs: replace all generic "digital agency" questions with:  
Who is Hardik Yadav? / What does Hardik Yadav do? / Is Hardik Yadav a full-stack developer? / What technologies does Hardik Yadav use? / Does Hardik Yadav build AI-integrated applications? / What projects has Hardik Yadav built? / Where can I see Hardik Yadav's code? / Where can I read Hardik Yadav's articles? / How can I contact Hardik Yadav? / Where can I find Hardik Yadav on social media? / What is "HRDK"? Write real answers for each.
- /projects: fix the 6 "Explore Project" links currently pointing to "#" (Vertexiae Platform, Earnetix Hub, Earnetix Updates, Garry Digital 360, Delta Traders, Ratna Kanchan) — either link to their real live URLs or clearly label them "In Progress" / remove the CTA until a real URL exists.

### 2. METADATA (per-page, unique, not duplicated site-wide):

- Home: title "Hardik Yadav (HRDK) — Full-Stack Developer & Software Engineer"; meta description "Hardik Yadav (HRDK) is a full-stack developer from India building web apps with React, Next.js, and Node.js. Explore projects, skills, and contact info."; H1 "Hardik Yadav — Full-Stack Developer".
- About: title "About Hardik Yadav — Full-Stack Developer"; unique meta description summarizing the real bio; H1 "About Hardik Yadav".
- Projects: title "Projects by Hardik Yadav — Full-Stack Developer Portfolio"; H1 "Projects".

- Blog: title "Hardik Yadav's Developer Blog"; H1 "Blog".
- FAQs: title "Frequently Asked Questions — Hardik Yadav"; H1 "FAQs".
- Contact: title "Contact Hardik Yadav"; H1 "Contact".

Add canonical `<link rel="canonical">` on every page pointing to its own exact URL on <https://hardikyadav.vercel.app>.

Add Open Graph (og:title, og:description, og:image, og:url) and Twitter Card meta tags site-wide, using one shared default OG image plus per-project OG images once project pages exist.

### 3. STRUCTURED DATA (JSON-LD, add via Next.js metadata/script tags):

- Person schema on the homepage: name "Hardik Yadav", alternateName "HRDK", jobTitle "Full-Stack Developer", addressLocality "Bokaro Steel City", addressCountry "IN", sameAs:   
["<https://github.com/fullstack-hardik>",   
"<https://www.linkedin.com/in/hardik-yadav-682016301/>",   
"[https://instagram.com/official\\_hrdik\\_yadav](https://instagram.com/official_hrdik_yadav)"].
- WebSite schema on the homepage, publisher referencing the Person @id.
- ProfilePage schema wrapping the About page, mainEntity referencing the Person @id.
- BreadcrumbList schema on every inner page.
- FAQPage schema on /faqs using the real Q&A content from step 1.
- Do NOT add Course, Organization, or Review/AggregateRating schema — none apply to this real site.

### 4. TECHNICAL SEO FILES:

- Verify or create robots.txt:   
User-agent: \*   
Allow: /   
Sitemap: <https://hardikyadav.vercel.app/sitemap.xml>   
(Disallow any real private/auth routes if they exist — check what the "Sign Up" button in the header actually leads to and exclude that route if it's a non-public account area.)
- Implement a dynamic sitemap via app/sitemap.ts covering: /, /about, /projects, /projects/[slug] for live projects only, /blog, /blog/[slug] for published posts only, /faqs, /contact.
- Add manifest.webmanifest: name "Hardik Yadav (HRDK) — Full-Stack Developer", short\_name "HRDK", description matching the homepage meta description, start\_url "/", display "standalone", real icons, and the site's actual theme color (confirm exact hex from the existing design system — do not guess).

### 5. INTERNAL LINKING:

- Every project card links to a real, working destination.
- Add "related projects" links from Skills to Projects and vice versa.

- Add "related articles" links from each project page to relevant blog posts once they exist.
- Ensure Contact is linked from Home, About, Projects, and Blog.

#### 6. IMAGE SEO:

- Rename project screenshots to descriptive filenames (e.g., vertex-crm-dashboard.png instead of proj\_task.png).
- Write specific, non-keyword-stuffed alt text for every image describing what is actually shown.
- Replace generic Unsplash stock photography on Home services section and the entire Gallery page with real project screenshots or workspace photos; if none are available yet, remove those image blocks rather than keep stock filler.

#### 7. PERFORMANCE:

- Audit the homepage hero video (hosted on CloudFront) for size/compression; add a poster frame to prevent layout shift; ensure it is not forcing a large payload on mobile.
- Continue using Next.js `<Image>` for all images (already partially in use) instead of raw `<img>` tags to [unsplash.com](https://unsplash.com).
- Do not alter animation timing, layout, or visual styling while making these performance changes.

#### 8. DOMAIN CONSOLIDATION:

- Set up 301 redirects from [whoishardik.vercel.app](https://whoishardik.vercel.app), [hardikai.vercel.app](https://hardikai.vercel.app), and [hardikcoding.vercel.app](https://hardikcoding.vercel.app) to [hardikyadav.vercel.app](https://hardikyadav.vercel.app) (confirmed identical duplicates).
- Audit [hardikchatgpt.vercel.app](https://hardikchatgpt.vercel.app), [hardikgoogle.vercel.app](https://hardikgoogle.vercel.app), [hardiky.vercel.app](https://hardiky.vercel.app), and [hardikdeveloper.vercel.app](https://hardikdeveloper.vercel.app) for actual content before redirecting; if identical duplicates, redirect the same way; if genuinely distinct, add a canonical tag back to the primary domain instead of redirecting.

#### 9. TESTING CHECKLIST BEFORE SHIPPING:

- Confirm no visual regression versus the current live design (side-by-side screenshot comparison of every page).
- Validate all JSON-LD with Google's Rich Results Test.
- Validate robots.txt and sitemap.xml both return 200 and are correctly formatted.
- Confirm all internal links resolve (zero remaining "#" placeholder hrefs on interactive CTAs).
- Run Lighthouse/PageSpeed Insights before and after the video/image performance changes to confirm improvement without visual change.
- Re-crawl every page's rendered HTML to confirm the real name

"Hardik Yadav" appears in title, H1, and body copy — not just in the logo/brand mark.

---

## **Final note**

Nothing in this report requires fake claims, fake reviews, fake backlinks, keyword stuffing, or hundreds of thrown-together SEO pages. The single highest-leverage action available to you is removing the fabricated testimonial content and the leftover template copy — that alone resolves the biggest trust and duplicate-content problems on the site, before any keyword or schema work even begins.
